

IMPLEMENT CLIENT SCRIPT & UI POLICY(INCIDENT)

PHASE 2 REQUIREMENT ANALYSIS

2.1 Introduction

- Requirement Analysis is the process of identifying the requirements and expected behaviour of the proposed system.
- The project “**Implement Client Script & UI Policy (Incident)**” is developed using the **ServiceNow Incident Management** module.
- The main purpose of this phase is to identify the functions, system behaviour, software requirements, and hardware requirements needed for the project.
- The project focuses on improving Incident data quality by using **UI Policies and Client Scripts** to control fields, automatically update values, validate information, and control State changes.

2.2 Purpose of Requirement Analysis

The main purposes of requirement analysis are:

- To identify the required system functions.
- To define the behaviour of Incident fields.
- To improve data accuracy and consistency.

2.3 Functional Requirements

Functional requirements describe the functions that the system must perform.

2.3.1 High Impact UI Policy

A UI Policy named “**High Impact Control**” shall be created on the Incident table.

Condition:

- Impact = 1 – **High**

When the condition is active, the defined UI Policy actions should be applied.

2.3.2 Assignment Group Mandatory

When Impact is High:

- **Assignment Group** shall become mandatory.
- The mandatory behaviour shall be reversed when the condition becomes false.

2.3.3 Urgency Read-Only

When Impact is High:

- **Urgency** shall become read-only.
- The field shall remain visible on the Incident form.

2.3.4 Automatic Urgency Update

An onChange Client Script shall be created on the Impact field.

Urgency → Automatically set to High

2.3.5 Save Validation

An onSubmit Client Script shall validate the Incident before saving.

If:

Impact = High + Assigned To = Empty

then:

Incident Save → Prevented

An appropriate error message shall be displayed.

2.3.6 State Control

An onCellEdit Client Script shall prevent direct State changes through Incident list editing.

However:

List Editing → State change blocked

Incident Form → State change allowed

Incident form → State change allowed

2.4 NON-FUNCTIONAL REQUIREMENTS

Non-functional requirements describe the quality and expected behaviour of the system.

The system should:

Maintain clear and consistent configuration.

Respond correctly to specified Incident conditions.

Improve data integrity and form usability.

The configuration should also be lightweight and suitable for a short-duration micro project.

2.5 SOFTWARE REQUIREMENTS

The following software and access requirements are needed:

ServiceNow Instance - Used for Incident Management, UI Policy configuration, and Client Script implementation.

Web Browser - Used to access the ServiceNow instance and perform configuration and testing.

Internet Connection - Required to access the ServiceNow instance.

Administrative / Configuration Access - Required to create and modify the required ServiceNow configurations.

2.6 HARDWARE REQUIREMENTS

Laptop / Desktop

A laptop or desktop is required for:

- Accessing ServiceNow
- Configuration
- Script creation
- Testing
- Documentation

Internet Connection

2.7 EXPECTED SYSTEM BEHAVIOUR

The requirements should produce the following behaviour:

High Impact Incident

Impact = High

↓

Assignment Group → Mandatory

Urgency → Read-only

Urgency → Automatically High

Assigned To Validation

Impact = High

•

Assigned To = Empty

↓

Save → Blocked

↓

Error Message Displayed

State Control

Incident List

→ Direct State change **Blocked**

Incident Form

→ State change **Allowed**

2.8 OVERALL REQUIREMENT FLOW

User enters Incident details

↓

Impact is changed

↓

System checks the condition

↓

UI Policy / Client Script applies

↓

Fields are controlled or updated

↓

User clicks Submit

↓

Validation is performed

↓

Incident is Saved / Blocked

2.9 CONCLUSION

The Requirement Analysis phase defines the functional, non-functional, software, and hardware requirements of the **Implement Client Script & UI Policy (Incident)** project.

The functional requirements define how Assignment Group, Urgency, Assigned To, and State should behave. The non-functional requirements focus on clear configuration, condition-based response, data integrity, usability, and lightweight implementation.
