

Implement Client Script & UI Policy (Incident)

Project Design

Introduction

The Project Design phase defines how the proposed ServiceNow Incident Management solution will work before implementation. This phase describes the overall flow, UI Policy configuration, UI Policy Action for Urgency, Client Script behaviour, and the complete design flow. The design focuses on improving Incident data quality by applying conditional field behaviour, automatic updates, validation, and controlled State changes.

3.1 Overall Flow

The project is designed to improve data accuracy and consistency in the ServiceNow Incident Management module. When a user opens or updates an Incident record, the configured conditions are checked automatically.

User opens Incident Form → enters or changes Incident details → defined conditions are evaluated → UI Policy/Client Script applies the configured behaviour → validation is performed → Incident is saved only when the required conditions are satisfied.

3.2 UI Policy Design

A UI Policy named “High Impact Control” is created on the Incident table. It is triggered when Impact is set to 1 – High. Under this condition, Assignment group becomes mandatory. The policy is configured to reverse its changes when the condition becomes false.

Item	Design
Policy Name	High Impact Control
Table	Incident
Condition	Impact is 1 – High
Action	Assignment group becomes Mandatory
Reverse if False	True

3.3 UI Policy Action – Urgency

A UI Policy Action is configured for the Urgency field. When Impact is High, Urgency is made read-only while remaining visible on the Incident form. This prevents the user from manually changing Urgency when the High Impact condition is active.

Field	Setting	Purpose
Urgency	Read-only = True	Prevent changing Urgency when Impact is High
Urgency	Visible = Unchanged	Keep the field visible on the form

3.4 Client Script Design

Three Client Scripts are used to implement the required Incident behaviour. The onChange script automatically updates Urgency, the onSubmit script validates Assigned To before saving, and the onCellEdit script prevents direct State changes through list editing.

Script Type	Field/Scope	Purpose
onChange	Impact	Automatically set Urgency to High when Impact is High
onSubmit	Incident	Prevent saving when Assigned To is empty for High Impact
onCellEdit	State	Block direct State changes through list editing

3.5 Design Flow Diagram

Incident Form

Impact Changed

UI Policy + onChange Client Script

Assignment Group Mandatory / Urgency Read-only / Urgency Automatically Set

User Clicks Submit

onSubmit Validation

Save Allowed or Blocked

List State Edit → onCellEdit Blocks Direct Edit

Conclusion

The Project Design phase establishes the complete structure and behaviour of the ServiceNow Incident Management solution. The design combines a UI Policy, a UI Policy Action, and three Client Scripts to control fields based on Incident conditions. It ensures that Assignment group becomes mandatory for High Impact Incidents, Urgency is controlled and automatically updated, incomplete records are prevented from being saved, and direct State changes through list editing are blocked. This design provides a clear foundation for the development and testing phases of the project.
