

IMPLEMENT CLIENT SCRIPT & UI POLICY(INCIDENT)

PHASE 1

BRAINSTORM AND IDEATION

1.1 Introduction

- The Brainstorming and Ideation phase is the initial stage of the project, where the main issues in the ServiceNow Incident form are identified and possible solutions are generated.
- During this phase, different ideas are explored to improve data quality, user experience, consistency and efficiency of the Incident form.
- The identified ideas are then converted into practical requirements by deciding where UI Policies or Client Scripts can be used for form behavior, validation and dynamic logic.

1.2 Brainstorming Objective

The main objective of brainstorming is to generate practical ideas that can improve the Incident form without making it unnecessarily complex.

The brainstorming process focuses on identifying ways to:

- Improve the usability of the Incident form.
- Ensure that important Incident information is captured.
- Reduce incomplete and incorrect data entry.
- Display only relevant fields based on the current condition.
- Protect selected information from accidental modification.
- Provide appropriate validation and user guidance.
- Identify situations where UI Policies can be used effectively.
- Identify situations where Client Scripts are required for custom logic.
- Develop a simple and maintainable solution aligned with the Incident Management process.

The overall objective is to understand the requirement clearly before moving into actual implementation.

1.3 Problem Identification

- Users may enter incomplete Incident information, causing delays during assignment, diagnosis and resolution.
- Some fields are relevant only for particular Incident conditions, but the standard form may show them all the time.
- Users can accidentally change information that should remain protected after a specific condition is reached.

1.4. Brainstorming – Idea Generation

A brainstorming session can begin with the question: “How can the Incident form guide users to enter the right information at the right time?” The following ideas were generated for the project.

Idea	Purpose / Expected Benefit
Make important fields mandatory	Ensures critical Incident information is captured before submission or progression.
Show or hide fields based on conditions	Reduces unnecessary information on the form and improves usability.
Make selected fields read-only	Protects important information from unintended changes.
Validate user-entered values	Prevents invalid or inconsistent data from being entered.
Display helpful messages	Guides users when a value is missing, incorrect or requires attention.
React to field changes	Automatically adjusts the form when priority, category or another relevant field changes.
Use clear field dependencies	Makes related fields easier to complete and improves data consistency.
Avoid unnecessary scripting	Keeps the implementation simple and improves maintainability.

1.5 Ideation – Converting Ideas into Requirements

After brainstorming, the ideas are filtered and converted into specific functional requirements. The key principle is to use a UI Policy for straightforward form-state changes and a Client Script when conditional logic or validation needs scripting.

Requirement	Possible Implementation	Reason
Critical fields should be mandatory when required	UI Policy	Simple mandatory behavior without unnecessary scripting.
A field should become read-only under a defined condition	UI Policy	Clear and maintainable form control.
A field should be hidden when it is not relevant	UI Policy	Improves user experience and reduces clutter.
A value must satisfy a custom validation rule	Client Script	Allows dynamic validation beyond basic UI behavior.
Form should respond immediately to a field change	Client Script / UI Policy	Provides dynamic user guidance.
User should receive a clear message for invalid input	Client Script	Supports immediate feedback and correction.

1.6. Proposed Incident Form Scenarios

Scenario 1 – Priority-Based Control

When an Incident reaches a defined priority, selected information can be made mandatory or read-only according to the project requirement.

This helps ensure that important information is captured and protected when necessary.

Scenario 2 – Category-Dependent Fields

When a particular Incident category is selected, related fields can be displayed and required while irrelevant fields remain hidden.

This makes the Incident form more relevant to the current situation.

Scenario 3 – Data Validation

When a user enters a value that does not satisfy the required business rule, a Client Script can provide immediate feedback.

This helps prevent invalid or inconsistent information from being entered.

Scenario 4 – User Guidance

When a form condition changes, the interface can guide the user by showing relevant fields or messages instead of relying only on documentation.

This provides better interaction between the user and the Incident form.

1.7 Ideation Outcome / Proposed Solution

Based on the brainstorming and ideation activities, a combined approach using UI Policies and Client Scripts is proposed.

- UI Policies will be considered for simple field-state changes such as mandatory, visible and read-only behavior.
- Client Scripts will be considered for custom validation and dynamic client-side logic.
- The solution will avoid unnecessary scripting where a UI Policy can satisfy the requirement.
- Conditions will be defined clearly before implementing each rule.
- The proposed solution will be tested using normal, valid and invalid user-input scenarios.
- The implementation should improve the Incident form without unnecessarily affecting the existing Incident Management process.

The proposed approach provides a clear separation between simple form control and custom client-side logic.

1.8 Expected Benefits

The proposed ideas are expected to provide the following benefits:

- Improved completeness and quality of Incident information.

- Reduced data-entry errors and invalid values.
- Better visibility of relevant fields.
- Reduced unnecessary information on the Incident form.
- Improved protection of important information.
- Better user guidance during Incident creation and update.
- More consistent Incident data entry.
- Reduced need for manual correction.
- Better maintainability by using UI Policies and Client Scripts appropriately.
- Improved overall usability of the Incident form.

1.9 Conclusion

The Brainstorming and Ideation phase identifies the major issues in the Incident form and converts them into practical requirements. The proposed use of UI Policies and Client Scripts provides a structured approach for improving form behavior, validation and user guidance. This phase provides a clear foundation for the implementation stage.
